

# NAVSUP Training Session

The AI Squared Team – 03/27/2024

# Introduction

Welcome to the AI Squared training document for the NAVSUP training session taking place on 03/27/2024! We are excited to be providing this training session, and hope this document helps provide the user with some guidance along the way.

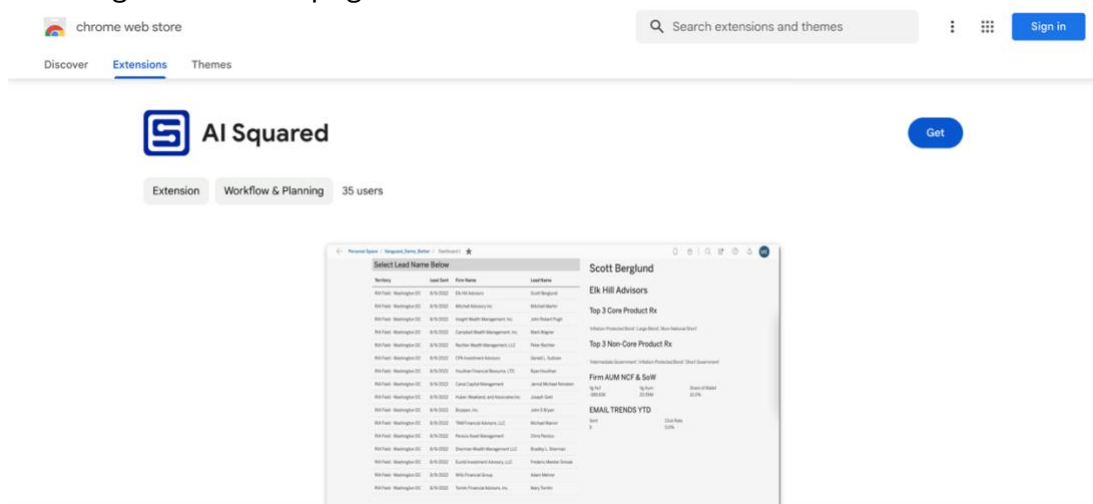

Before we begin, let's outline what we will be doing during this workshop:

1. Downloading and installing the AI Squared Browser Extension in either Google Chrome or Microsoft Edge.
2. Connecting to the AI Squared platform via the AI Squared Browser Extension.
3. Running the existing model cards in the AI Squared Platform
4. Building a model card – Supply Chain LLM
5. Building a model card – Reverse ETL for SOS Dashboard
6. Building a model card – Text Summarizer using a deployed open source LLM

## Browser Extension Setup

Let's go ahead and get the browser extension downloaded and installed. First, in either Google Chrome or Microsoft Edge, please go to the following link: [AI Squared \(google.com\)](#)

It should bring the user to a page that looks like this:

Go ahead and click the “Get” button and follow any prompts to install the extension. Once installed, it’s recommended to pin the extension for easy access.

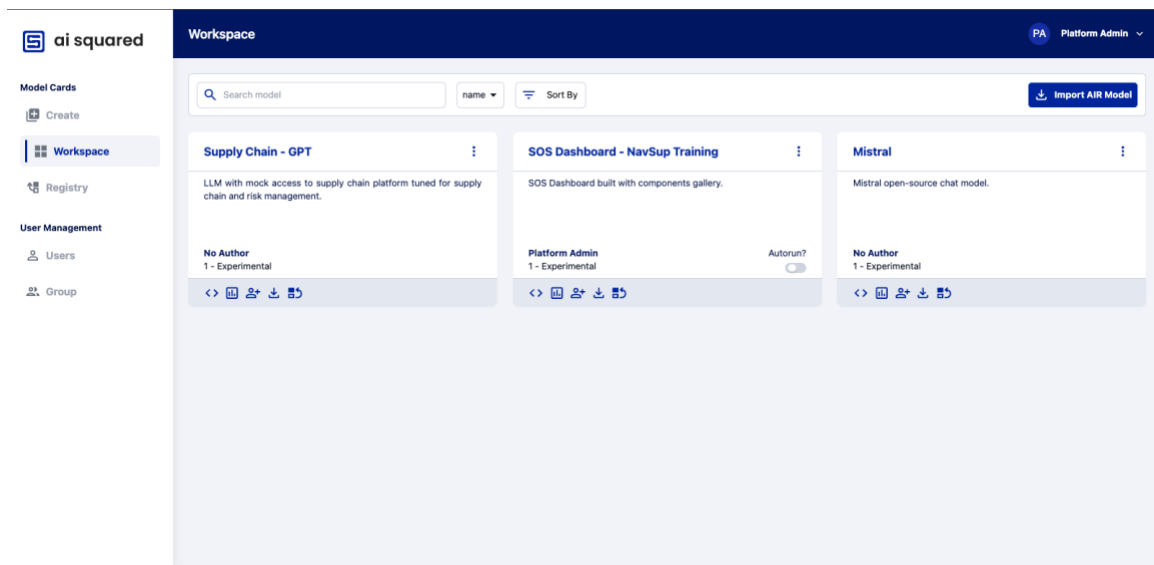

Now that the extension is installed, it's time to log into platform using the extension. Go ahead and click on the extension icon at the top of the browser page, and then in the URL field enter the URL <https://training.squared.ai>. Once the extension connects to the platform, the user can click the “Continue” button, then “Log in”, and provide the

credentials we will or already have given the user. Once the user has successfully logged in, the user will be able to reference the AI Squared workspace directly on the webpage. This will allow the model results to be injected into the Document Object Model (DOM) of the HTML page of the downstream web application.

By clicking on the pinned extension button on the toolbar, the user can call model cards from the workspace or registry, add new models and configure other settings. This will be most useful when the user would like to test models before they are set to auto-run in production.

## Workspace Overview

Now that the user has successfully logged into the AI Squared Extension and Platform, let's start running some of the model cards in the platform!

After the user has installed and set up the extension, we will shift focus towards the workspace management window. This is a specific workspace configured for each client environment. The user can access the AI Squared platform here: [training.squared.ai](https://training.squared.ai)

The initial window in the AI Squared Platform is known as the 'Workspace'. From here the user can view all their published model cards, inquire about specific model results and feedback, create new models from scratch or clones and more.

These models cards offer a great deal of configurability and customization. The platform provides a no-code and a low-code approach to creating, publishing and updating each specific model card. The user has the option to create the model via the AI Squared interface on the platform itself, or to create the model behind the scenes and upload a

compatible .air file directly onto the platform. This can be done by connecting to the AI Squared Python API (high-code compatibility). See python documentation [here](#).

## Creating Model Cards

The following steps will be broken up into their configuration step assignment in the platform. The user will be able to follow this guide as a compliment to the training to create the three model cards. The first card is the Supply Chain LLM, the second card is the SOS Dashboard and the third card is the open-source Mistral model. We will ultimately launch all of the model cards using the extension that has already been installed.

To start, the user should go to [training.squared.ai](https://training.squared.ai) and login if not done already. Toggle over to the workspace pane to see the three pre-built model cards. From here the user can look into each of the specific steps for the necessary configuration. When creating a new model card from scratch simply click in the 'Create' tab on the left-hand pane. Shall we begin?

### **What is a Model Card?**

A model card represents a unique workflow that can be configured to accomplish a variety of tasks. Model cards can be used to run typical ETL jobs, data transformations, machine learning pipelines, end-to-end inference pipelines and more. The standard model card at AI Squared is comprised of 6 configuration steps: Harvesting, Analytic, Preprocessing, Postprocessing, Rendering and Feedback. All of these configuration steps serve a distinct purpose in the workflow generation and each of the steps can be completely customized to fit the specific requirements of your organizational workflow.

## Use Case 1 | Supply Chain - GPT

### **Harvester:**

The harvester step is the first step in the model creation process and will determine the method in which the data is extracted from the Document Object Model (DOM) or end-user input. In this case, we will be using a chatbot harvester.

Steps:

- Click into the harvester step and select Chatbot class
- Name the model anything you would like; this will appear at the top of the chatbot widget.
- **Save Changes**

**Harvesters**  
How to harvest the data from DOM

ChatbotHarvester

**Harvest class**

Save Changes Remove Class

### Analytic:

The analytics menu allows the user to add custom analytic steps relative to their specific workflow needs. The process involves selecting and configuring the type of analytic operation that will be applied to the data. This step is crucial for defining how the platform connects to the data source or endpoint and how the data is processed, analyzed and modeled within the platform.

Steps:

- Select 'Deployed Analytic' from the menu dropdown. *Feel free to ask about all of the available connectors*
- Populate the URL with our deployed model endpoint:  
<https://exiger-gpt.salmonwater-6b11f82f.eastus.azurecontainerapps.io/predict>  
<http://aisquared-2xa100.eastus.cloudapp.azure.com:2244/predict>
- Define the Method as 'POST'
- Populate the Header\* as needed:
  - {"Content-Type":"application/json"}
- Populate the Body\* as needed:
  - {"prompt":"{{input}}"}
- **Save Changes**

The screenshot shows the 'Analytics' configuration page in the AI Squared platform. At the top, there's a header with 'Analytics' and a subtitle 'Remote or local analytic models given a route/path'. A progress indicator shows '1 step added'. Below this is a dropdown menu labeled 'Analytic class' with the text 'Choose analytic class'. A list titled '# Analytic Class' contains one item: '1. ModelInvoke'. The main section is titled 'Deployed Model' and contains several fields: 'Name' (ModelInvoke), 'URL\*' (https://exiger-gpt.salmonwater-6b11f82f.eastus.azurecontainerapps.io/predict), 'Method\*' (POST selected, GET unselected), 'Headers\*' (Content-Type: application/json), and 'Body\*' (prompt: {{input}}). A note at the bottom says 'Use "{{input}}" variable to use harvested data value.' At the bottom right are 'Save Changes' and 'Cancel' buttons.

**Preprocessing:**

The preprocessing menu dropdown gives the user the ability to specific processing steps to the harvested data fields. This will allow for proper setup before the targeted data is used to retrieve model results

Steps:

- No changes necessary

**Postprocessing:**

The postprocessing step in the AI Squared platform involves applying specific transformations to the output of models, tailoring the results to be more interpretable or suitable for further use.

Steps:

- No changes necessary

**Rendering:**

The rendering functionality allows the user to fully customize how the model results are displayed on the end-user application. The model results are typically stored in a container that is injected into an element within the DOM. Each rendering option has a unique degree

of customization available, and the custom rendering option allows the user to bring fully executable code for any specific web development components necessary.

Steps:

- Select 'Chat Rendering' from the dropdown menu.
- Change the Label if needed.
- Provide a name for the user in the 'Title for sender's bubble' window. Default: 'You'
- Provide a name for the model in the 'Title for responder's bubble' window. Default: 'Supply Chain – GPT'
- Write 'response' in the Value Key pane.
- **Save Changes**

### **Feedback:**

The feedback step in the AI Squared platform is designed to gather end-user responses and opinions about the model's predictions, which is crucial for model evaluation and improvement. The feedback widgets appear in the bottom right hand of the target webpage and can be configured to display how the user would like. The feedback is generally

collected from end-users and sent directly back to the platform where it can be inferred on by pipeline managers, product managers, data scientists, etc.

Steps:

- Select 'SimpleFeedback' from the dropdown menu
- Ignore 'Bucket' and 'File Name'
- Set 'Prediction Name Key' to 'name'
- Set 'Prediction Value Key' to 'value'
- + Add 'Is the answer correct?' in the Quality Questions Pane.
- **Save Changes**

#	Questions
1.	Is the answer correct?

Save Changes Cancel

### **Playing the Model:**

Now let's go to any webpage and launch the model from the extension. Select the AI Squared Extension and play the 'Supply Chain – GPT' Model. Once the chatbot widget pops up, here are some pre-configured prompts that we can use:

1. What are the greatest risks to our contract supplying textiles to XYZ corp?
2. What are some of our suppliers that pose the greatest risk of unsustainable business practices?
3. What is our risk posture across contracts if there are increased sanctions in China? What are some other providers for some of our contracts we could use?

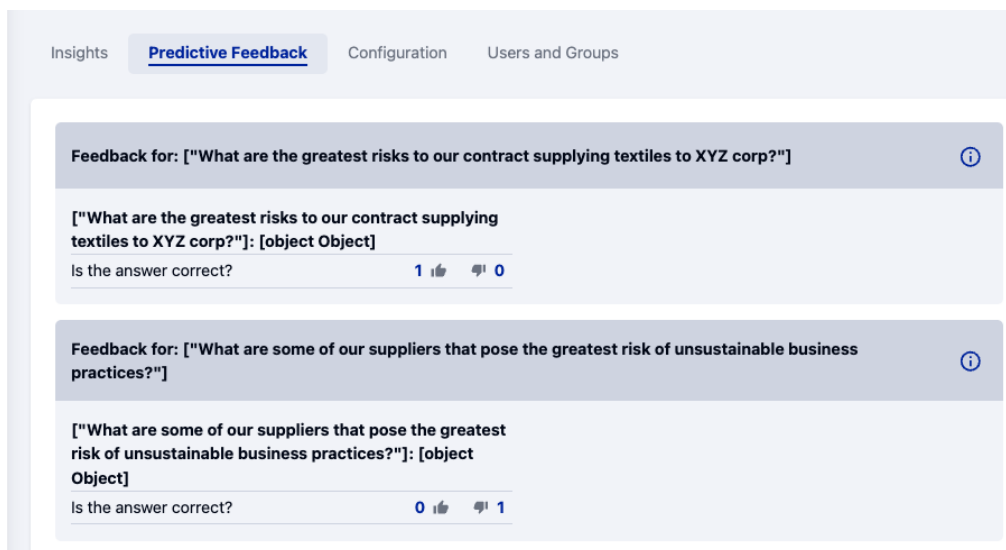

- InnovationCorp, which provides us with cotton from Egypt, was just found to be utilizing forced labor. We have to use a different supplier - what portion of our cotton supply comes from InnovationCorp, and what are the best alternative suppliers?

### Using Feedback:

Once we are prompted with a response, provide some feedback to the model. After you have provided feedback, go back to the platform and select the small bar chart on the model card.

Users can use this pane to track usage. Toggle to the 'Predictive Feedback' pane to see the updated feedback responses.

## Use Case 2 | Predictive (SOS) Dashboard

The next model we are going to create is a simple dashboard used to deliver a batch of inferences as well as historical data to our end users. This model will scrape the end user web application for an ID/harvester then will communicate with a model repository and send the results back to the web application. The results will be rendered directly within the HTML webpage to allow the user to look at the specific inferences related to their workflow.

### **Harvester Steps:**

- Select 'Text Harvester' from the dropdown menu.
- Select 'Regex'
- Type 'Alice Alison' into the Regex Pattern pane. Text fields can be delimited by using a |.
- Type 'gu' into the Regex Flags pane
- **Save Changes**

The screenshot shows the 'SOS Dashboard - NavSup Training' interface. At the top, there are tabs for 'AIR config steps' and 'JSON config'. Below this is a section titled 'Harvesters' with a sub-header 'How to harvest the data from DOM'. A dropdown menu for 'Harvest class' is set to 'Text Harvester'. Under 'How to harvest text?', the 'Regex' option is selected. The 'Regex pattern' field contains 'Alice Alison' and the 'Regex flags' field contains 'gu'. At the bottom of the configuration pane, there is a blue 'Save Changes' button and a red 'Remove Class' link.

### **Analytic Steps:**

- Select 'AWS s3' from the analytic class dropdown menu
- Provide a name for the class. 's3'
- Bucket Name: 'ais-training-model-bucket'
- Primary Column: 'Lead\_Name'
- + Add 'SOS\_Sample\_for\_Dashboard\_edit9.csv' into the File names pane.
- Click 'Input' in the filter pane
- + Add 'Lead\_Name' as the Column Name
- Fetch Data Preview to ensure valid connection.
- **Save Changes**
